# LM1575/LM2575/LM2575HV SIMPLE SWITCHER ${ }^{\text {® }}$ 1A Step-Down Voltage Regulator 

## FEATURES

- 3.3V, 5V, 12V, 15V, and Adjustable Output Versions
- Adjustable Version Output Voltage Range, - $\quad 1.23 \mathrm{~V}$ to 37 V ( 57 V for HV Version) $\pm 4 \%$ Max Over
- Line and Load Conditions
- Specified 1A Output Current
- Wide Input Voltage Range, 40 V up to 60 V for HV Version
- Requires Only 4 External Components
- 52 kHz Fixed Frequency Internal Oscillator
- TTL Shutdown Capability, Low Power Standby Mode
- High Efficiency
- Uses Readily Available Standard Inductors
- Thermal Shutdown and Current Limit Protection
- $\mathbf{P}^{+}$Product Enhancement Tested

## APPLICATIONS

- Simple High-Efficiency Step-Down (Buck) Regulator
- Efficient Pre-Regulator for Linear Regulators
- On-Card Switching Regulators
- Positive to Negative Converter (Buck-Boost)

## DESCRIPTION

The LM2575 series of regulators are monolithic integrated circuits that provide all the active functions for a step-down (buck) switching regulator, capable of driving a 1A load with excellent line and load regulation. These devices are available in fixed output voltages of $3.3 \mathrm{~V}, 5 \mathrm{~V}, 12 \mathrm{~V}, 15 \mathrm{~V}$, and an adjustable output version.
Requiring a minimum number of external components, these regulators are simple to use and include internal frequency compensation and a fixedfrequency oscillator.
The LM2575 series offers a high-efficiency replacement for popular three-terminal linear regulators. It substantially reduces the size of the heat sink, and in many cases no heat sink is required.
A standard series of inductors optimized for use with the LM2575 are available from several different manufacturers. This feature greatly simplifies the design of switch-mode power supplies.
Other features include a specified $\pm 4 \%$ tolerance on output voltage within specified input voltages and output load conditions, and $\pm 10 \%$ on the oscillator frequency. External shutdown is included, featuring $50 \mu \mathrm{~A}$ (typical) standby current. The output switch includes cycle-by-cycle current limiting, as well as thermal shutdown for full protection under fault conditions.

## Typical Application

(Fixed Output Voltage Versions)

Pin numbers are for the TO-220 package.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## ABSOLUTE MAXIMUM RATINGS ${ }^{(1)(2)(3)}$

| Maximum Supply Voltage | LM1575/LM2575 | 45 V |
| :--- | :--- | ---: |
|  | LM2575HV | 63 V |
| $\overline{\mathrm{ON}} /$ OFF Pin Input Voltage | (Steady State) | $-0.3 \mathrm{~V} \leq \mathrm{V} \leq+\mathrm{V}_{\text {IN }}$ |
| Output Voltage to Ground | -1 V |  |
| Power Dissipation | Internally Limited |  |
| Storage Temperature Range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |  |
| Maximum Junction Temperature | $150^{\circ} \mathrm{C}$ |  |
| Minimum ESD Rating | (Soldering, 10 sec.) | 2 kV |
| Lead Temperature | $260^{\circ} \mathrm{C}$ |  |

(1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but do not ensure specific performance limits. For specified specifications and test conditions, see Electrical Characteristics.
(2) If Military/Aerospace specified devices are required, please contact the TI Sales Office/ Distributors for availability and specifications.
(3) Refer to RETS LM1575J for current revision of military RETS/SMD.

## OPERATING RATINGS

| Temperature Range | LM1575 | $-55^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{J}} \leq+150^{\circ} \mathrm{C}$ |
| :--- | :--- | ---: |
|  | LM2575/LM2575HV | $-40^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{J}} \leq+125^{\circ} \mathrm{C}$ |
| Supply Voltage | LM1575/LM2575 | 40 V |
|  | LM2575HV | 60 V |

## ELECTRICAL CHARACTERISTICS LM1575-3.3, LM2575-3.3, LM2575HV-3.3

Specifications with standard type face are for $\mathrm{T}_{J}=25^{\circ} \mathrm{C}$, and those with boldface type apply over full Operating Temperature Range .

(1) All limits specified at room temperature (standard type face) and at temperature extremes (bold type face). All limits are used to calculate Average Outgoing Quality Level, and all are $100 \%$ production tested.
(2) All limits specified at room temperature (standard type face) and at temperature extremes (bold type face). All room temperature limits are $100 \%$ production tested. All limits at temperature extremes are specified via correlation using standard Statistical Quality Control (SQC) methods.
(3) The oscillator frequency reduces to approximately 18 kHz in the event of an output short or an overload which causes the regulated output voltage to drop approximately $40 \%$ from the nominal output voltage. This self protection feature lowers the average power dissipation of the IC by lowering the minimum duty cycle from $5 \%$ down to approximately $2 \%$.
(4) Output (pin 2) sourcing current. No diode, inductor or capacitor connected to output pin.
(5) Feedback (pin 4) removed from output and connected to OV.
(6) Feedback (pin 4) removed from output and connected to +12 V for the Adjustable, 3.3 V , and 5 V versions, and +25 V for the 12 V and 15 V versions, to force the output transistor OFF.
(7) $\mathrm{V}_{\mathrm{IN}}=40 \mathrm{~V}$ ( 60 V for the high voltage version).
(8) Junction to ambient thermal resistance (no external heat sink) for the 5 lead TO-220 package mounted vertically, with $1 / 2$ inch leads in a socket, or on a PC board with minimum copper area.
(9) Junction to ambient thermal resistance (no external heat sink) for the 5 lead TO-220 package mounted vertically, with $1 / 2$ inch leads soldered to a PC board containing approximately 4 square inches of copper area surrounding the leads.
(10) Junction to ambient thermal resistance with approximately 1 square inch of pc board copper surrounding the leads. Additional copper area will lower thermal resistance further. See thermal model in Switchers made Simple software.
(11) If the DDPAK/TO-263 package is used, the thermal resistance can be reduced by increasing the PC board copper area thermally connected to the package: Using 0.5 square inches of copper area, $\theta_{\mathrm{JA}}$ is $50^{\circ} \mathrm{C} / \mathrm{W}$; with 1 square inch of copper area, $\theta_{\mathrm{JA}}$ is $37^{\circ} \mathrm{C} / \mathrm{W}$; and with 1.6 or more square inches of copper area, $\theta_{\mathrm{JA}}$ is $32^{\circ} \mathrm{C} / \mathrm{W}$.

## ELECTRICAL CHARACTERISTICS ALL OUTPUT VOLTAGE VERSIONS (continued)

Specifications with standard type face are for $\mathrm{T}_{J}=25^{\circ} \mathrm{C}$, and those with boldface type apply over full Operating Temperature Range. Unless otherwise specified, $\mathrm{V}_{\mathbb{I N}}=12 \mathrm{~V}$ for the $3.3 \mathrm{~V}, 5 \mathrm{~V}$, and Adjustable version, $\mathrm{V}_{\mathbb{I N}}=25 \mathrm{~V}$ for the 12 V version, and $\mathrm{V}_{\mathrm{IN}}=30 \mathrm{~V}$ for the 15 V version. $\mathrm{I}_{\text {LOAD }}=200 \mathrm{~mA}$.

## TEST CIRCUIT AND LAYOUT GUIDELINES

As in any switching regulator, layout is very important. Rapidly switching currents associated with wiring inductance generate voltage transients which can cause problems. For minimal inductance and ground loops, the length of the leads indicated by heavy lines should be kept as short as possible. Single-point grounding (as indicated) or ground plane construction should be used for best results. When using the Adjustable version, physically locate the programming resistors near the regulator, to keep the sensitive feedback wiring short.

| PROCEDURE (Adjustable Output Voltage Versions) |
| :--- |
| Given: |
| $\mathrm{V}_{\text {OUT }}=$ Regulated Output Voltage |
| $\mathrm{V}_{\text {IN }}(\mathrm{Max})=$ Maximum Input Voltage |
| $\mathrm{I}_{\mathrm{LOAD}}(\mathrm{Max})=$ Maximum Load Current |
| $\mathrm{F}=$ Switching Frequency (Fixed at 52 kHz$)$ |
| 1. Programming Output Voltage (Selecting R1 and R2, as shown | in Figure 25 and Figure 26)

Use the following formula to select the appropriate resistor values.

$$
\begin{equation*}
\mathrm{V}_{\text {OUT }}=\mathrm{V}_{\text {REF }}\left(1+\frac{\mathrm{R} 2}{\mathrm{R} 1}\right) \quad \text { where } \mathrm{V}_{\text {REF }}=1.23 \mathrm{~V} \tag{1}
\end{equation*}
$$

$R_{1}$ can be between 1 k and 5 k . (For best temperature coefficient and stability with time, use $1 \%$ metal film resistors)

$$
\begin{equation*}
\mathrm{R} 2=\mathrm{R} 1\left(\frac{\mathrm{~V}_{\mathrm{OUT}}}{\mathrm{~V}_{\mathrm{REF}}}-1\right) \tag{2}
\end{equation*}
$$

## 2. Inductor Selection (L1)

A. Calculate the inductor Volt • microsecond constant,
$\mathrm{E} \cdot \mathrm{T}(\mathrm{V} \cdot \mu \mathrm{s})$, from the following formula:

$$
\begin{equation*}
\mathrm{E} \cdot \mathrm{~T}=\left(\mathrm{V}_{\mathrm{IN}}-\mathrm{V}_{\mathrm{OUT}}\right) \frac{\mathrm{V}_{\mathrm{OUT}}}{\mathrm{~V}_{\mathrm{IN}}} \cdot \frac{1000}{\mathrm{~F}(\text { in } k H z)}(\mathrm{V} \bullet \mu \mathrm{~s}) \tag{4}
\end{equation*}
$$

B. Use the $\mathrm{E} \cdot \mathrm{T}$ value from the previous formula and match it with the E - T number on the vertical axis of the Inductor Value Selection Guide shown in Figure 31.
C. On the horizontal axis, select the maximum load current.
D. Identify the inductance region intersected by the E•T value and the maximum load current value, and note the inductor code for that region.
E. Identify the inductor value from the inductor code, and select an appropriate inductor from the table shown in Table 2. Part numbers are listed for three inductor manufacturers. The inductor chosen must be rated for operation at the LM2575 switching frequency (52 kHz ) and for a current rating of $1.15 \times \mathrm{l}_{\text {LOAD }}$. For additional inductor information, see INDUCTOR SELECTION.

## 3. Output Capacitor Selection ( $\mathrm{C}_{\mathrm{OUT}}$ )

A. The value of the output capacitor together with the inductor defines the dominate pole-pair of the switching regulator loop. For stable operation, the capacitor must satisfy the following requirement:

$$
\begin{equation*}
\mathrm{C}_{\text {OUT }} \geq 7,785 \frac{\mathrm{~V}_{\text {IN }}(\mathrm{Max})}{\mathrm{V}_{\text {OUT }} \bullet \mathrm{L}(\mu \mathrm{H})}(\mu \mathrm{F}) \tag{6}
\end{equation*}
$$

The above formula yields capacitor values between $10 \mu \mathrm{~F}$ and 2000 $\mu \mathrm{F}$ that will satisfy the loop requirements for stable operation. But to achieve an acceptable output ripple voltage, (approximately 1\% of the output voltage) and transient response, the output capacitor may need to be several times larger than the above formula yields.
B. The capacitor's voltage rating should be at last 1.5 times greater than the output voltage. For a 10 V regulator, a rating of at least 15 V or more is recommended.
Higher voltage electrolytic capacitors generally have lower ESR numbers, and for this reason it may be necessary to select a capacitor rate for a higher voltage than would normally be needed.
(Continued)

## EXAMPLE (Adjustable Output Voltage Versions)

## Given:

$V_{\text {OUT }}=10 \mathrm{~V}$
$\mathrm{V}_{\text {IN }}(\mathrm{Max})=25 \mathrm{~V}$
${ }^{\text {LOAD }}(\mathrm{Max})=1 \mathrm{~A}$
$\mathrm{F}=52 \mathrm{kHz}$

1. Programming Output Voltage (Selecting R1 and R2)

$$
\begin{align*}
& V_{\text {OUT }}=1.23\left(1+\frac{R 2}{R 1}\right) \quad \text { Select } R 1=1 k \\
& R 2=R 1\left(\frac{V_{\text {OUT }}}{V_{\text {REF }}}-1\right)=1 \mathrm{k}\left(\frac{10 \mathrm{~V}}{1.23 \mathrm{~V}}-1\right) \tag{3}
\end{align*}
$$

$R 2=1 k(8.13-1)=7.13 k$, closest $1 \%$ value is $7.15 k$
B. $\mathrm{E} \cdot \mathrm{T}=115 \mathrm{~V} \cdot \mu \mathrm{~s}$
C. $\mathrm{I}_{\text {LOAD }}(\mathrm{Max})=1 \mathrm{~A}$
D. Inductance Region $=\mathrm{H} 470$
E. Inductor Value $=470 \mu \mathrm{H}$ Choose from AIE part \#430-0634, Pulse Engineering part \#PE-53118, or Renco part \#RL-1961.

## 3. Output Capacitor Selection (Cout)

A.

$$
\begin{equation*}
\mathrm{C}_{\text {OUT }}>7,785 \frac{25}{10 \cdot 150}=130 \mu \mathrm{~F} \tag{7}
\end{equation*}
$$

However, for acceptable output ripple voltage select
$\mathrm{C}_{\text {OUT }} \geq 220 \mu \mathrm{~F}$
$\mathrm{C}_{\text {OUt }}=220 \mu \mathrm{~F}$ electrolytic capacitor

| PROCEDURE (Adjustable Output Voltage Versions) |

## APPLICATION HINTS

## INPUT CAPACITOR (CIN)

To maintain stability, the regulator input pin must be bypassed with at least a $47 \mu \mathrm{~F}$ electrolytic capacitor. The capacitor's leads must be kept short, and located near the regulator.
If the operating temperature range includes temperatures below $-25^{\circ} \mathrm{C}$, the input capacitor value may need to be larger. With most electrolytic capacitors, the capacitance value decreases and the ESR increases with lower temperatures and age. Paralleling a ceramic or solid tantalum capacitor will increase the regulator stability at cold temperatures. For maximum capacitor operating lifetime, the capacitor's RMS ripple current rating should be greater than

$$
\begin{align*}
& 1.2 \times\left(\frac{t_{\mathrm{ON}}}{T}\right) \times I_{\text {LOAD }} \\
& \text { where } \frac{t_{\mathrm{ON}}}{T}=\frac{V_{O U T}}{V_{I N}} \text { for a buck regulator } \\
& \text { and } \frac{t_{\mathrm{ON}}}{T}=\frac{\left|V_{O U T}\right|}{\left|V_{O U T}\right|+V_{\text {IN }}} \text { for a buck-boost regulator. } \tag{8}
\end{align*}
$$

## INDUCTOR SELECTION

All switching regulators have two basic modes of operation: continuous and discontinuous. The difference between the two types relates to the inductor current, whether it is flowing continuously, or if it drops to zero for a period of time in the normal switching cycle. Each mode has distinctively different operating characteristics, which can affect the regulator performance and requirements.
The LM2575 (or any of the Simple Switcher family) can be used for both continuous and discontinuous modes of operation.
The inductor value selection guides in Figure 27 through Figure 31 were designed for buck regulator designs of the continuous inductor current type. When using inductor values shown in the inductor selection guide, the peak-to-peak inductor ripple current will be approximately $20 \%$ to $30 \%$ of the maximum DC current. With relatively heavy load currents, the circuit operates in the continuous mode (inductor current always flowing), but under light load conditions, the circuit will be forced to the discontinuous mode (inductor current falls to zero for a period of time). This discontinuous mode of operation is perfectly acceptable. For light loads (less than approximately 200 mA ) it may be desirable to operate the regulator in the discontinuous mode, primarily because of the lower inductor values required for the discontinuous mode.
The selection guide chooses inductor values suitable for continuous mode operation, but if the inductor value chosen is prohibitively high, the designer should investigate the possibility of discontinuous operation. The computer design software Switchers Made Simple will provide all component values for discontinuous (as well as continuous) mode of operation.
Inductors are available in different styles such as pot core, toriod, E-frame, bobbin core, etc., as well as different core materials, such as ferrites and powdered iron. The least expensive, the bobbin core type, consists of wire wrapped on a ferrite rod core. This type of construction makes for an inexpensive inductor, but since the magnetic flux is not completely contained within the core, it generates more electromagnetic interference (EMI). This EMI can cause problems in sensitive circuits, or can give incorrect scope readings because of induced voltages in the scope probe.

The inductors listed in the selection chart include ferrite pot core construction for AIE, powdered iron toroid for Pulse Engineering, and ferrite bobbin core for Renco.

An inductor should not be operated beyond its maximum rated current because it may saturate. When an inductor begins to saturate, the inductance decreases rapidly and the inductor begins to look mainly resistive (the DC resistance of the winding). This will cause the switch current to rise very rapidly. Different inductor types have different saturation characteristics, and this should be kept in mind when selecting an inductor.

The inductor manufacturer's data sheets include current and energy limits to avoid inductor saturation.

## INDUCTOR RIPPLE CURRENT

When the switcher is operating in the continuous mode, the inductor current waveform ranges from a triangular to a sawtooth type of waveform (depending on the input voltage). For a given input voltage and output voltage, the peak-to-peak amplitude of this inductor current waveform remains constant. As the load current rises or falls, the entire sawtooth current waveform also rises or falls. The average DC value of this waveform is equal to the DC load current (in the buck regulator configuration).

If the load current drops to a low enough level, the bottom of the sawtooth current waveform will reach zero, and the switcher will change to a discontinuous mode of operation. This is a perfectly acceptable mode of operation. Any buck switching regulator (no matter how large the inductor value is) will be forced to run discontinuous if the load current is light enough.

## OUTPUT CAPACITOR

An output capacitor is required to filter the output voltage and is needed for loop stability. The capacitor should be located near the LM2575 using short pc board traces. Standard aluminum electrolytics are usually adequate, but low ESR types are recommended for low output ripple voltage and good stability. The ESR of a capacitor depends on many factors, some which are: the value, the voltage rating, physical size and the type of construction. In general, low value or low voltage (less than 12 V ) electrolytic capacitors usually have higher ESR numbers.

The amount of output ripple voltage is primarily a function of the ESR (Equivalent Series Resistance) of the output capacitor and the amplitude of the inductor ripple current ( $\Delta \mathrm{I}_{\text {IND }}$ ). (See INDUCTOR RIPPLE CURRENT).
The lower capacitor values ( $220 \mu \mathrm{~F}-680 \mu \mathrm{~F}$ ) will allow typically 50 mV to 150 mV of output ripple voltage, while larger-value capacitors will reduce the ripple to approximately 20 mV to 50 mV .

Output Ripple Voltage $=\left(\Delta \mathrm{I}_{\mathrm{ND}}\right)\left(E S R\right.$ of $\left.\mathrm{C}_{\text {out }}\right)$
To further reduce the output ripple voltage, several standard electrolytic capacitors may be paralleled, or a higher-grade capacitor may be used. Such capacitors are often called "high-frequency," "low-inductance," or "low-ESR." These will reduce the output ripple to 10 mV or 20 mV . However, when operating in the continuous mode, reducing the ESR below $0.05 \Omega$ can cause instability in the regulator.
Tantalum capacitors can have a very low ESR, and should be carefully evaluated if it is the only output capacitor. Because of their good low temperature characteristics, a tantalum can be used in parallel with aluminum electrolytics, with the tantalum making up $10 \%$ or $20 \%$ of the total capacitance.
The capacitor's ripple current rating at 52 kHz should be at least $50 \%$ higher than the peak-to-peak inductor ripple current.

## CATCH DIODE

Buck regulators require a diode to provide a return path for the inductor current when the switch is off. This diode should be located close to the LM2575 using short leads and short printed circuit traces.

Because of their fast switching speed and low forward voltage drop, Schottky diodes provide the best efficiency, especially in low output voltage switching regulators (less than 5V). Fast-Recovery, High-Efficiency, or Ultra-Fast Recovery diodes are also suitable, but some types with an abrupt turn-off characteristic may cause instability and EMI problems. A fast-recovery diode with soft recovery characteristics is a better choice. Standard 60 Hz diodes (example: 1 N4001 or 1 N5400, and so on.) are also not suitable. See Table 1 for Schottky and "soft" fastrecovery diode selection guide.

## OUTPUT VOLTAGE RIPPLE AND TRANSIENTS

The output voltage of a switching power supply will contain a sawtooth ripple voltage at the switcher frequency, typically about $1 \%$ of the output voltage, and may also contain short voltage spikes at the peaks of the sawtooth waveform.

The output ripple voltage is due mainly to the inductor sawtooth ripple current multiplied by the ESR of the output capacitor. (See INDUCTOR SELECTION)
The voltage spikes are present because of the fast switching action of the output switch, and the parasitic inductance of the output filter capacitor. To minimize these voltage spikes, special low inductance capacitors can be used, and their lead lengths must be kept short. Wiring inductance, stray capacitance, as well as the scope probe used to evaluate these transients, all contribute to the amplitude of these spikes.
An additional small LC filter ( $20 \mu \mathrm{H} \& 100 \mu \mathrm{~F}$ ) can be added to the output (as shown in Figure 37) to further reduce the amount of output ripple and transients. A $10 \times$ reduction in output ripple voltage and transients is possible with this filter.

## FEEDBACK CONNECTION

The LM2575 (fixed voltage versions) feedback pin must be wired to the output voltage point of the switching power supply. When using the adjustable version, physically locate both output voltage programming resistors near the LM2575 to avoid picking up unwanted noise. Avoid using resistors greater than $100 \mathrm{k} \Omega$ because of the increased chance of noise pickup.

## $\overline{\text { ON }}$ /OFF INPUT

For normal operation, the $\overline{\mathrm{ON}}$ /OFF pin should be grounded or driven with a low-level TTL voltage (typically below 1.6 V ). To put the regulator into standby mode, drive this pin with a high-level TTL or CMOS signal. The $\overline{\mathrm{ON}} / \mathrm{OFF}$ pin can be safely pulled up to $+\mathrm{V}_{\text {IN }}$ without a resistor in series with it. The $\overline{\mathrm{ON}} / \mathrm{OFF}$ pin should not be left open.

## GROUNDING

To maintain output voltage stability, the power ground connections must be low-impedance (see Figure 26). For the TO-3 style package, the case is ground. For the 5-lead TO-220 style package, both the tab and pin 3 are ground and either connection may be used, as they are both part of the same copper lead frame.
With the CDIP or SOIC packages, all the pins labeled ground, power ground, or signal ground should be soldered directly to wide printed circuit board copper traces. This assures both low inductance connections and good thermal properties.

## HEAT SINK/THERMAL CONSIDERATIONS

In many cases, no heat sink is required to keep the LM2575 junction temperature within the allowed operating range. For each application, to determine whether or not a heat sink will be required, the following must be identified:

1. Maximum ambient temperature (in the application).
2. Maximum regulator power dissipation (in application).
3. Maximum allowed junction temperature $\left(150^{\circ} \mathrm{C}\right.$ for the LM1575 or $125^{\circ} \mathrm{C}$ for the LM2575). For a safe, conservative design, a temperature approximately $15^{\circ} \mathrm{C}$ cooler than the maximum temperature should be selected.
4. LM2575 package thermal resistances $\theta_{\mathrm{JA}}$ and $\theta_{\mathrm{Jc}}$.

Total power dissipated by the LM2575 can be estimated as follows:
$P_{\mathrm{D}}=\left(\mathrm{V}_{\mathbb{I}}\right)\left(\mathrm{I}_{\mathrm{Q}}\right)+\left(\mathrm{V}_{\mathrm{O}} \mathrm{V}_{\mathbb{I N}}\right)\left(\mathrm{I}_{\text {LOAD }}\right)\left(\mathrm{V}_{\text {SAT }}\right)$
where

- $\mathrm{I}_{\mathrm{Q}}$ (quiescent current) and $\mathrm{V}_{\text {SAT }}$ can be found in the Characteristic Curves shown previously,
- $\mathrm{V}_{\mathrm{IN}}$ is the applied minimum input voltage,
- $\mathrm{V}_{\mathrm{O}}$ is the regulated output voltage
- and $I_{\text {LOAD }}$ is the load current.

The dynamic losses during turn-on and turn-off are negligible if a Schottky type catch diode is used.
When no heat sink is used, the junction temperature rise can be determined by the following:

$$
\begin{equation*}
\Delta T_{J}=\left(P_{D}\right)\left(\theta_{\mathrm{JA}}\right) \tag{11}
\end{equation*}
$$

To arrive at the actual operating junction temperature, add the junction temperature rise to the maximum ambient temperature.

$$
\begin{equation*}
T_{J}=\Delta T_{J}+T_{A} \tag{12}
\end{equation*}
$$

If the actual operating junction temperature is greater than the selected safe operating junction temperature determined in step 3, then a heat sink is required.
When using a heat sink, the junction temperature rise can be determined by the following:

$$
\begin{equation*}
\Delta T_{J}=\left(P_{D}\right)\left(\theta_{\mathrm{JC}}+\theta_{\text {interface }}+\theta_{\text {Heat sink }}\right) \tag{13}
\end{equation*}
$$

The operating junction temperature will be:

$$
\begin{equation*}
\mathrm{T}_{\mathrm{J}}=\mathrm{T}_{\mathrm{A}}+\Delta \mathrm{T}_{\mathrm{J}} \tag{14}
\end{equation*}
$$

As shown in Equation 14, if the actual operating junction temperature is greater than the selected safe operating junction temperature, then a larger heat sink is required (one that has a lower thermal resistance).
When using the LM2575 in the plastic CDIP or surface mount SOIC packages, several items about the thermal properties of the packages should be understood. The majority of the heat is conducted out of the package through the leads, with a minor portion through the plastic parts of the package. Since the lead frame is solid copper, heat from the die is readily conducted through the leads to the printed circuit board copper, which is acting as a heat sink.
For best thermal performance, the ground pins and all the unconnected pins should be soldered to generous amounts of printed circuit board copper, such as a ground plane. Large areas of copper provide the best transfer of heat to the surrounding air. Copper on both sides of the board is also helpful in getting the heat away from the package, even if there is no direct copper contact between the two sides. Thermal resistance numbers as low as $40^{\circ} \mathrm{C} / \mathrm{W}$ for the SOIC package, and $30^{\circ} \mathrm{C} / \mathrm{W}$ for the CDIP package can be realized with a carefully engineered pc board.

Included on the Switchers Made Simple design software is a more precise (non-linear) thermal model that can be used to determine junction temperature with different input-output parameters or different component values. It can also calculate the heat sink thermal resistance required to maintain the regulators junction temperature below the maximum operating temperature.

## ADDITIONAL APPLICATIONS

## INVERTING REGULATOR

Figure 32 shows a LM2575-12 in a buck-boost configuration to generate a negative 12V output from a positive input voltage. This circuit bootstraps the regulator's ground pin to the negative output voltage, then by grounding the feedback pin, the regulator senses the inverted output voltage and regulates it to -12 V .
For an input voltage of 12 V or more, the maximum available output current in this configuration is approximately 0.35A. At lighter loads, the minimum input voltage required drops to approximately 4.7 V .

The switch currents in this buck-boost configuration are higher than in the standard buck-mode design, thus lowering the available output current. Also, the start-up input current of the buck-boost converter is higher than the standard buck-mode regulator, and this may overload an input power source with a current limit less than 1.5A. Using a delayed turn-on or an undervoltage lockout circuit (described in the NEGATIVE BOOST REGULATOR section) would allow the input voltage to rise to a high enough level before the switcher would be allowed to turn on.
Because of the structural differences between the buck and the buck-boost regulator topologies, the buck regulator design procedure section cannot be used to select the inductor or the output capacitor. The recommended range of inductor values for the buck-boost design is between $68 \mu \mathrm{H}$ and $220 \mu \mathrm{H}$, and the output capacitor values must be larger than what is normally required for buck designs. Low input voltages or high output currents require a large value output capacitor (in the thousands of micro Farads).

The peak inductor current, which is the same as the peak switch current, can be calculated from the following formula:

$$
\mathrm{I}_{\mathrm{p}} \approx \frac{\mathrm{I}_{\mathrm{LOAD}}\left(\mathrm{~V}_{\mathrm{IN}}+\left|\mathrm{V}_{\mathrm{O}}\right|\right)}{\mathrm{V}_{\mathrm{IN}}}+\frac{\mathrm{V}_{\mathrm{IN}}\left|\mathrm{~V}_{\mathrm{O}}\right|}{\mathrm{V}_{\mathrm{IN}}+\left|V_{\mathrm{O}}\right|} \times \frac{1}{2 \mathrm{~L}_{1} \mathrm{f}_{\mathrm{OSC}}}
$$

where

$$
\begin{equation*}
\text { - } \mathrm{f}_{\mathrm{osc}}=52 \mathrm{kHz} \text {. } \tag{15}
\end{equation*}
$$

Under normal continuous inductor current operating conditions, the minimum $\mathrm{V}_{\mathbb{I N}}$ represents the worst case. Select an inductor that is rated for the peak current anticipated.
Also, the maximum voltage appearing across the regulator is the absolute sum of the input and output voltage. For a -12 V output, the maximum input voltage for the LM2575 is +28 V , or +48 V for the LM2575HV.
The Switchers Made Simple (version 3.3) design software can be used to determine the feasibility of regulator designs using different topologies, different input-output parameters, different components, and so on.

Figure 32. Inverting Buck-Boost Develops -12V

## NEGATIVE BOOST REGULATOR

Another variation on the buck-boost topology is the negative boost configuration. The circuit in Figure 33 accepts an input voltage ranging from -5 V to -12 V and provides a regulated -12 V output. Input voltages greater than -12 V will cause the output to rise above -12 V , but will not damage the regulator.
Because of the boosting function of this type of regulator, the switch current is relatively high, especially at low input voltages. Output load current limitations are a result of the maximum current rating of the switch. Also, boost regulators can not provide current limiting load protection in the event of a shorted load, so some other means (such as a fuse) may be necessary.

Typical Load Current
200 mA for $\mathrm{V}_{\mathrm{IN}}=-5.2 \mathrm{~V}$
500 mA for $\mathrm{V}_{\mathrm{IN}}=-7 \mathrm{~V}$
Pin numbers are for TO-220 package.

## Figure 33. Negative Boost

## UNDERVOLTAGE LOCKOUT

In some applications it is desirable to keep the regulator off until the input voltage reaches a certain threshold. An undervoltage lockout circuit which accomplishes this task is shown in Figure 34, while Figure 35 shows the same circuit applied to a buck-boost configuration. These circuits keep the regulator off until the input voltage reaches a predetermined level.

$$
\begin{equation*}
V_{T H} \approx V_{Z 1}+2 V_{B E}(Q 1) \tag{16}
\end{equation*}
$$

## DELAYED STARTUP

The $\overline{O N} / O F F$ pin can be used to provide a delayed startup feature as shown in Figure 36. With an input voltage of 20 V and for the part values shown, the circuit provides approximately 10 ms of delay time before the circuit begins switching. Increasing the RC time constant can provide longer delay times. But excessively large RC time constants can cause problems with input voltages that are high in 60 Hz or 120 Hz ripple, by coupling the ripple into the $\overline{O N} / O F F$ pin.

## ADJUSTABLE OUTPUT, LOW-RIPPLE POWER SUPPLY

A 1A power supply that features an adjustable output voltage is shown in Figure 37. An additional L-C filter that reduces the output ripple by a factor of 10 or more is included in this circuit.

Complete circuit not shown.
Pin numbers are for the TO-220 package.
Figure 34. Undervoltage Lockout for Buck Circuit

Complete circuit not shown (see Figure 32).
Pin numbers are for the TO-220 package.

## Definition of Terms

BUCK REGULATORA switching regulator topology in which a higher voltage is converted to a lower voltage. Also known as a step-down switching regulator.
BUCK-BOOST REGULATORA switching regulator topology in which a positive voltage is converted to a negative voltage without a transformer.

DUTY CYCLE (D) Ratio of the output switch's on-time to the oscillator period.

$$
\begin{align*}
\text { for buck regulator } & D & =\frac{t_{\mathrm{ON}}}{T} & =\frac{\mathrm{V}_{\mathrm{OUT}}}{\mathrm{~V}_{I N}} \\
\text { for buck-boost regulator } & \mathrm{D} & =\frac{t_{\mathrm{ON}}}{T} & =\frac{\left|\mathrm{V}_{\mathrm{O}}\right|}{\left|\mathrm{V}_{\mathrm{O}}\right|+\mathrm{V}_{\mathrm{IN}}} \tag{17}
\end{align*}
$$

CATCH DIODE OR CURRENT STEERING DIODE The diode which provides a return path for the load current when the LM2575 switch is OFF.

EFFICIENCY $(\mathbf{\eta})$ The proportion of input power actually delivered to the load.

$$
\begin{equation*}
\eta=\frac{\text { POUT }^{\text {PIN }}}{\text { PIN }^{2}}=\frac{\text { POUT }}{\text { POUT }+ \text { PLOSS }} \tag{18}
\end{equation*}
$$

CAPACITOR EQUIVALENT SERIES RESISTANCE (ESR) The purely resistive component of a real capacitor's impedance (see Figure 38). It causes power loss resulting in capacitor heating, which directly affects the capacitor's operating lifetime. When used as a switching regulator output filter, higher ESR values result in higher output ripple voltages.

Figure 38. Simple Model of a Real Capacitor
Most standard aluminum electrolytic capacitors in the $100 \mu \mathrm{~F}-1000 \mu \mathrm{~F}$ range have $0.5 \Omega$ to $0.1 \Omega$ ESR. Higher-grade capacitors ("low-ESR", "high-frequency", or "low-inductance"') in the $100 \mu \mathrm{~F}-1000 \mu \mathrm{~F}$ range generally have ESR of less than $0.15 \Omega$.

EQUIVALENT SERIES INDUCTANCE (ESL)The pure inductance component of a capacitor (see Figure 38). The amount of inductance is determined to a large extent on the capacitor's construction. In a buck regulator, this unwanted inductance causes voltage spikes to appear on the output.

OUTPUT RIPPLE VOLTAGE The AC component of the switching regulator's output voltage. It is usually dominated by the output capacitor's ESR multiplied by the inductor's ripple current ( $\Delta \mathrm{I}_{\mathrm{IND}}$ ). The peak-topeak value of this sawtooth ripple current can be determined by reading INDUCTOR RIPPLE CURRENT.

CAPACITOR RIPPLE CURRENTRMS value of the maximum allowable alternating current at which a capacitor can be operated continuously at a specified temperature.
STANDBY QUIESCENT CURRENT (I striy ) Supply current required by the LM2575 when in the standby mode (ON /OFF pin is driven to TTL-high voltage, thus turning the output switch OFF).
INDUCTOR RIPPLE CURRENT ( $\Delta \mathbf{I}_{\text {IND }}$ ) The peak-to-peak value of the inductor current waveform, typically a sawtooth waveform when the regulator is operating in the continuous mode (vs. discontinuous mode).
CONTINUOUS/DISCONTINUOUS MODE OPERATIONRelates to the inductor current. In the continuous mode, the inductor current is always flowing and never drops to zero, vs. the discontinuous mode, where the inductor current drops to zero for a period of time in the normal switching cycle.
INDUCTOR SATURATIONThe condition which exists when an inductor cannot hold any more magnetic flux. When an inductor saturates, the inductor appears less inductive and the resistive component dominates. Inductor current is then limited only by the DC resistance of the wire and the available source current.
OPERATING VOLT MICROSECOND CONSTANT (E•T $\mathrm{T}_{\mathrm{op}}$ ) The product (in Volt $\cdot \mu \mathrm{s}$ ) of the voltage applied to the inductor and the time the voltage is applied. This $\mathrm{E} \cdot \mathrm{T}_{\text {op }}$ constant is a measure of the energy handling capability of an inductor and is dependent upon the type of core, the core area, the number of turns, and the duty cycle.

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but Tl does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS \& no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb -Free/Green conversion plan has not been defined
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb -Free (RoHS compatible) as defined above.
Green (RoHS \& no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed $0.1 \%$ by weight in homogeneous material)
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents Tl's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## NDH0005D

DW (R-PDSO-G24) PLASTIC SMALL OUTLINE

NOTES: A. All linear dimensions are in inches (millimeters). Dimensioning and tolerancing per ASME Y14.5M-1994.
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusion not to exceed $0.006(0,15)$.
D. Falls within JEDEC MS-013 variation AD.

## NEB0005F

KC (R-PSFM-T5)
PLASTIC FLANGE-MOUNT PACKAGE

NOTES: A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.
C. All lead dimensions apply before solder dip.
D. The center lead is in electrical contact with the mounting tab.

E These features are optional.
A Thermal pad contour optional within these dimensions.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to Tl's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in Tl's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.
TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.
TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.
Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.
Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.
In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, Tl's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.
No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.
Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have not been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.
TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.

## Products

Audio
Amplifiers
Data Converters
DLP® Products
DSP
Clocks and Timers
Interface
Logic
Power Mgmt
Microcontrollers
RFID
OMAP Applications Processors
