

SN55500E, SN65500E, SN75500E AC PLASMA DISPLAY DRIVERS

SLDS013B - D2471, DECEMBER 1985 - REVISED MAY 1993

- Controls 32 Electrodes
- 100-V Totem-Pole Outputs
- Low Standby Power Consumption
- All Outputs Contain Sink and Source Clamp Diodes
- 15-mA Steady-State Output Current
- Rugged DMOS Outputs
- CMOS Inputs
- Direct Replacement for SN55500D and SN75500A

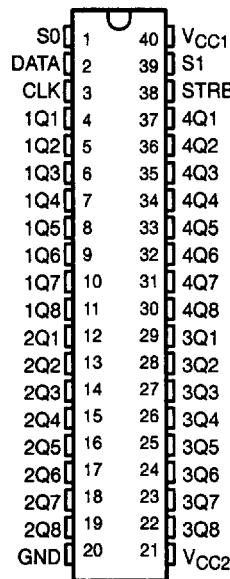

description

The SN55500E, SN65500E, and SN75500E are monolithic BIDFET[†] integrated circuits designed to perform the line-select operation of a matrix-addressable display. The device inputs are diode-clamped CMOS inputs.

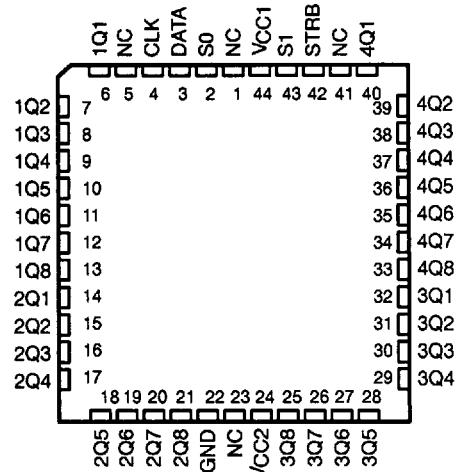

The outputs of these drivers are normally low and can be selectively switched high when the strobe input is low. Selection of the outputs is achieved through the data S0 and S1 inputs. The 8-bit data stored internally in the serial register is inverted and sent to one of four output sections by the 2-line to 4-line decoder. All other outputs remain low. Internal circuits provide a high-current pulse to the level-shifting circuit during positive output transitions. When the output transition is complete, the low steady-state current reduces the circuit's standby power consumption. All outputs contain clamp diodes to the VCC2 and GND supply inputs.

The SN55500E is characterized for operation over the full military temperature range of -55°C to 125°C. The SN65500E is characterized for operation from -40°C to 85°C. The SN75500E is characterized for operation from 0°C to 70°C.

H = high level, L = low level, X = irrelevant, ↑ = low-to-high transition.

R1 ... R8 = levels currently at internal outputs of shift registers one through eight, respectively.

R1_n ... R8_n = levels at shift-register outputs R1 through R8, respectively, before the most recent ↑ transition of the clock.
