1. General Description

FS9922-DMM4 is a high performance, low power consumption and 3 6/7 digits (6000 Counts) dual Analog to Digital Converter with a built-in microprocessor. It includes a 8 bits microprocessor, low noise and the OPAMP of high stability, AC rectifier OPAMP, voltage doubling and regulated voltage, highly regulated bandgap, auto measurement switch and function control circuit, buzzer driver circuit, clock oscillation circuit, backlight display control circuit, LCD driver circuit and so on.

Built-in dual Analog to Digital Converter , one is a high accuracy ADC for main measurement; the other is a high speed ADC whose measurement result shows by a 61 segment analog section bar that can respond fast, the analog indication owns the property of immediate response and can provide the fast measurement and monitoring of instant signals.

With the microprocessor, FS9922-DMM4 can do the logic function control via the I/O ports. By selecting the codes of MEA1~MEA5 pins can realize various functions during measurement.

By triggering the keys of the settings of SELECT, RANGE, REL/RS232, HZ/DUTY, HOLD/LIGHT, MAX/MIN keys, you can realize the functions of function switch, measurement mode select, relative value measurement, frequency/duty cycle measurement, reading hold, MAX/MIN value hold, backlight display, RS232 output and so on.

With the auto power off function, when there is no action on the mode switch or keys of the meter within 15 minutes, the system will enter into the sleep mode automatically to save the power. This function can also be cancelled during use.

FS9922-DMM4 has LCD driver circuits, which is designed for driving LCD.

FS9922-DMM4 is made by the large integrated circuit technology, and therefore greatly rises up the reliability of the product. It makes the design simple, the volume small, low power consumption by using 3V power source, and convenient to use the power supply of battery, especially suitable for the application on the palm mode meter.

FS9922-DMM4 is a microprocessor-embedded and multifunctional measuring dual ADC; fewer external components added can form a high accuracy, multifunctional and low cost measuring meter.

2. Features

- Max. Display: 6000 Counts (Frequency 9999), Bar graph 61 segments.
- Converter Rate: 3 times/sec; Bar graph: 30 times/sec.
- Measuring Mode: Auto/Manual measurement.
- Pole Indication: Auto.
- Operation Voltage: 2.4V~3.6V.
- Operation Current: $\leq 2\text{mA}$
- Low Power Indication: about 2.4V.
- Buzzer Frequency: about 2.7kHz.
- AC Rectifying: Embedded OPAMP.
- Current Resistance: μA is 50Ω ; mA is 0.5Ω ; A is 0.005Ω .
- Function Keys: SELECT, RANGE, REL/ RS232, HZ/DUTY, HOLD/ LIGHT, MAX/MIN.
- Data Output: RS232 (2400bps).
- Auto Power-off: 15min. (can be cancelled)
- Unit Symbol and Backlight Display.

3. Measuring Mode

- DCV: 60.00mV, 600.0mV, 6.000V, 60.00V, 600.0V, 6000V.
- ACV: 60.00mV, 600.0mV, 6.000V, 60.00V, 600.0V, 6000V.
- DCA: 600.0 μ A/6000 μ A, 60.00mA/600.0mA, 6.000A/60.00A, 600.0A, 6000A.
- ACA: 600.0 μ A/6000 μ A, 60.00mA/600.0mA, 6.000A/60.00A, 600.0A, 6000A.
- OHM: 600.0 Ω , 6.000k Ω , 60.00k Ω , 600.0k Ω , 6.000M Ω , 60.00M Ω .
- Capacitance: 40.00nF, 400.0nF, 4.000 μ F, 40.00 μ F, 400.0 μ F, 4000 μ F(30sec.).
- Frequency: 9.999Hz, 99.99Hz, 999.9Hz, 9.999kHz, 99.99kHz, 999.9kHz, 9.999MHz.
- RPM: 9.999kRPM, 99.99kRPM.
- Duty Cycle: 0.1%~99.9%.
- Temperature: -273.0°C~+400.0°C(-459.4°F ,+752.0°F)/ -273°C~+ 4000°C(-459°F ,+7232°F).
- Diode Test: 0V~2.0V.
- Continuity Test: Test on 600.0 Ω mode; sound when lower than 30 Ω .
- Transistor hFE: 0~1000(hFE).

4. Applications Field

- Auto Measurement Palm Mode Digital Multifunctional Meter.
- Auto Measurement Card Digital Multifunctional Meter.
- Auto-Measurement Pen Digital Multifunctional Meter.
- Auto-Measurement Clamp Meter.
- Number Panel Meter.

8. Technical Specification

8.1 Max. Rated Value

Parameter	Symbol	Rated Value	Unit
Power Supply Voltage	VDD~VSS	3.6	V
I/O Voltage Level	Vid	-0.3 ~ VDD +0.3	V
Ambient Temperature	Ta	0 ~ + 70	°C
Storage Temperature	Tstg	-40 ~ + 125	°C
Welding Temperature	Temp	280	°C
Welding Time	Time	5	s

8.2 Electrical Parameters

Symbol	Parameter	Test Condition	Min.	Typical	Max.	Unit
VDD	Recommended Operation Power Voltage		2.4		3.6	V
IDD	Operation Current	In DCV Mode		1.5	3	mA
IPO	Sleep Current	In Auto Power-off Status			10	µA
VIH	Digital High Voltage Level		VDD-0.5			V
VIL	Digital Low Voltage Level				0.5	V
AGND	Analog Ground Voltage		VDDA/2 -3%	VDDA/2	VDDA/2 +3%	V
VDDA	Analog Power Supply		3.4	3.9	4.4	V
VBAND	Built in Bandgap Voltage	Voltage Relative to AGND	1.1	1.25	1.4	V
	Coefficient of curve of Bandgap Voltage along with power voltage	VDD=2.4~3.6V			2	mV/V
REFI	Recommended referenced Voltage	Voltage Relative to AGND		0.63		V
VBATT	Low Voltage Detector	Use DC 3V	2.25	2.4	2.55	V
FLCD	LCD Frequency			32		Hz
VLCD	LCD PK-PK Driver Voltage		2.8	3	3.2	V
FBEEP	Buzzer Frequency			2.7		KHz
FRS232	RS232 Baud Rate			2400		bps
IRSOUT	RS232 Transmission High Voltage Level Current	VOH=2V	2			mA
	"0" Input Reading	DC ADP×1 Input=0V	-1	0	1	digits
	Linearity (Max. Deviation From Best Straight Line Fit)	DC ADP×1 Full Scale±400mV	-1	0	1	Bit
	AC Measurement Bandwidth Error	AC ADP×1 Input 400mVrms 20Hz~1kHz			0.2	%
RCC	Continuity Check Value		10		60	Ω
	ADC Measurement O.L Display Count			6040		counts
	Auto range Up Count			6040		counts
	Auto range Down Count			560		counts
VFREA	Frequency Count Voltage (Hz/Duty Control)	VIL (relative to AGND) VIH (relative to AGND)	-60 500			mV
FMAXA	Max. Frequency Input (Hz/Duty Control)	Vpp=±100mV Square Wave Input			60	mV
*1	Duty Cycle Measurement Deviation (Hz/Duty Control)	Vpp=±100mV Square Wave Input			1	µs
VFRED	Frequency Count Input Voltage (MEAS=10100)	VIL (relative to AGND) VIH (relative to AGND)	-600 600			mV
FMAX	(MEAS=10100) Input Frequency of Frequency Count	Vpp=±600mV Square Wave Input	5			MHz
*1	(MEAS=10100) Duty Cycle Measurement Deviation	Vpp=±600mV Square Wave Input			100	ns
	Accuracy of Capacitance Measurement in Relative Value Measurement Status (by 600.0nF Mode standard adjustment)	60.00 nF Mode 600.0 nF Mode 6.000 µF Mode 60.00 µF Mode			2%+10 0.5%+3 1%+2 1.5%+2	digits

*1 During Duty Cycle measurement, when a square wave is input, the difference comes mainly from the analyzable impulse width difference of the competitor. If the input is a 100kHz square wave, which can be divided into 1000 counts, each count is 10 ns. Therefore, the max. difference is $(100\text{ns}/10\text{ ns}) = 10\text{Counts}$, $50.0\% \pm 1.0\%$ can be measured from 50.0% of output signal. The signal larger than 99% or less than 1% might not be able to be measured.

9. Measuring Modes Select

9.1 Coding Table

(MEA1~MEA5: no connection is “1”; connect to INT is “0”)

MEA5	MEA4	MEA3	MEA2	MEA1	Mode	SELECT	REL	HOLD	Hz Duty	RANGE	MAX MIN
1	0	1	1	0	AC V (6.000V~6000V)		•	•	•	•	•
1	1	0	1	0	DC V (600.0mV~6000V)		•	•		•	•
1	1	1	0	0	DC/AC mV (60.00mV/600.0mV)	DC/AC	•	•	•	•	•
1	0	0	0	1	DC / AC V(600.0mV~6000V)	DC/AC	•	•	•	•	•
1	0	0	1	0	Ohm / (Hi) Ohm	Ω/(Hi)Ω	•	•		•	•
1	0	1	0	0	Hz/Duty			•	•		
1	1	0	0	0	Diode/Beeper	D/B					
1	0	0	1	1	Cap.		•	•			
1	0	1	0	1	Ohm/ Diode/Beeper/cap.	Ω/D/B/C	•	•		•	•
1	1	0	0	1	RPM / Hi Hz	RPM / Hz		•			
1	0	1	1	1	°C/°F (-273.0°C~+400.0°C) /-273°C ~+ 4000°C	°C/°F	•	•		•	•
1	0	0	0	0	HFE

0	1	1	1	1	Ohm/Beeper/Diode	Ω/B/D	•	•		•	•

Note: “•” means the function key in the column is in operation

9.2 ADP Input/User-Defined Symbols and Confirmation of Decimal Locations

(MEA1~MEA5: no connection is “1”; connect to INT is “0”)

ME A5	ME A4	ME A3	ME A2	ME A1	Input Voltage Range	Input channel	Decimal Location	Symbol Location	Symbol
0	1	1	0	1	$\pm 600\text{mV}$	SA	6.000	COM4, SEG22	Defined by users
0	1	0	1	1			60.00	COM4, SEG23	
0	0	1	1	1			600.0	COM4, SEG24	
0	1	0	0	1			6000	COM4, SEG25	

Note: Character locations of “Hi” of High Frequency and High Resistance Measurement are in COM4, SEG31.

10. Keys Definition

10.1 RANGE Key

Range key is the Auto/Manual measurement key that acts with trigger. Auto measurement is pre-set as power-on, and switches to Manual measurement when the key is pressed one time. In Manual measurement mode, mode will move upward upon each press to the highest mode, then return to the lowest mode as a loop. If press the key over 2 seconds, the system will switch back to Auto measurement status.

10.2 RELΔ/RS232 Key

A. RELΔ Measurement

- 1) REL Δ /RS232 key is the relative value measurement/RS232 communication transmission key that acts with trigger. Press this key will enter into the relative value measurement mode. The system will save the display value in the memory as the reference value. When doing the measurement later, the display value will be the difference value that the entry value deducts the reference value.
- 2) REL Δ (current reading) = entry value – reference value
- 3) The relative value measurement can be carried out under the certain measurement mode, i.e., the function is available only under the Manual Measurement Mode.
- 4) Press REL Δ key will enter into the Manual Measurement Mode automatically.
- 5) In REL Δ measurement status, press the key again, the REL Δ function will be relocked.
- 6) Press the key in HOLD status, HOLD function will be cancelled. The system will save the display value in the memory as the reference value. When doing the measurement later, the display value is the difference that the entry value deducts the reference value.
- 7) Press RANGE, SELECT Key or use Mode Switch will cancel REL Δ measurement mode, and go back to the normal mode (REL Δ will disappear in the LCD).
- 8) OL triggering: Under REL Δ mode, OL shows when input value larger than the allowed value of the measurement mode. Press the key again, the relative measurement function will be cancelled. Disable to enter REL Δ mode when OL shows.
- 9) No analog section bar function under REL Δ mode.

B. RS232 Communication Transmission

- 1) Press REL Δ /RS232 key longer than 2 sec. will enter into RS232 and external set communication status ("RS232" shows in LCD).
- 2) After starting RS232 function, press REL Δ key again longer than 2 sec. RS232 function will be cancelled.
- 3) The auto power off function is cancelled in RS232 status, and the signal of "APO" in LCD disappears.

10.3 HOLD/LIGHT Key

HOLD/LIGHT is the reading hold/backlight control key.

A. Reading HOLD

- 1) Press the key, the display value will be locked and kept unchanged, "HOLD" shows in LCD. Press the key again, the locked status will be unlocked, and enter into the normal measurement status.
- 2) HOLD function will be unlocked and go back to the normal status when RANGE, SELECT, REL Key or Mode Switch is pressed or used.

B. BACK LIGHT CONTROL

- 1) The backlight control signal will be started when the HOLD key is pressed longer than 2 seconds; then, press the key again longer than 2 seconds, the backlight control signal will be shut off. If the HOLD Key is not pressed longer than 2 seconds after the backlight source is started, the light source will be shut off automatically in 10 seconds.

10.4 SELECT Key

- 1) SELECT Key is a function selection key that acts with trigger. Press the key can choose the needed measurement mode: To choose DC or AC in DC/AC status, to choose °C or °F in temperature measurement mode, to choose Diode or Buzzer in Diode/Buzzer status, to choose Ohm, Cap, Diode or Buzzer in Ohm/Cap/Diode/ Buzzer status.
- 2) Press the key then turn on the power, the Auto Power-off function will be cancelled, the signal "APO" disappears in LCD, and enter into Sleep Status (Power-Off). Press the key then power on will have the Auto Power-Off function.

10.5 HZ/DUTY Key

Hz/Duty is the key to select Frequency/Duty Cycle and it acts with trigger. In Frequency Measurement Mode, press the key can select Hz or Duty Measurement Mode; in AC/DC Voltage or AC/DC Current Measurement Mode, press the key can select Voltage/Hz/Duty or Current/Hz/Duty Measurement Mode.

10.6 MAX/MIN DATA HOLD Key

- 1) Press the MAX/MIN Key will enter into the MAX Mode, the measured max. value will be held; press the key again will enter into the MIN Mode, the measured min. value will be held; press the key again will repeat the a. m. circuit.
- 2) It will enter into the Manual Measurement Mode after enter into the MAX or Min Mode, RELΔ, HOLD, RANGE, SELECT Key function are not available under this mode.
- 3) The measured MAX or MIN value will be saved automatically when enter into MAX or MIN measurement mode.
- 4) No analog section bar function when enter into MAX or MIN mode, and the Auto Power Off function will be cancelled.
- 5) Press the MAX/MIN Key longer than 2 sec. will exit from the MAX or MIN measurement mode.

11. Other Functions

11.1 The indication of function signals, units will show in LCD when each of the functions is used.

11.2 The time for Auto Power-Off is set to be 15 minutes:

- 1) If the mode switch or keys of the meter is no action within 15 minutes, the system will power off automatically (sleep mode). In Auto Power-off status, press the function key or enable the function switch, the meter will "Auto Power-On" (Operation Mode).
- 2) The signal "APO" of Auto Power-off will show at the same time after the normal power on. The buzzer will remind 5 times sequentially one minute before it is shut off. It will enter into sleep (Power-off) status after a long sound before it is shut off. Enable the Mode Switch or press any key can restart it under the Auto Power-off mode.

11.3 Alarm Condition

- 1) Press the function key, the buzzer will sound "Be..." in short.
- 2) One minute before Auto Power-off the buzzer will sound "BeBeBeBeBe" five times to warn. Before it is shut off, the buzzer will sound a long "Beee" then shut off.
- 3) The buzzer will sound "BeBe..." continuously to warn when the measured DC voltage is higher than 1000V,
- 4) AC voltage is higher than 750V, or the measured DC/ACmV mode is higher than 600.0mV.
- 5) The buzzer will sound long when the short circuit resistance is less than the rated value during a short circuit test.

- 11.4 When the voltage is lower than the rated value (it is 2.4V under DC 3V power supply), the low voltage signal will show on LCD. When the power supply is by DC 9V or other voltage value, it can be external distributed to choose the proper voltage value to show the LV. symbol.
- 11.5 INT Input Terminal: When the meter enters into Auto Power-off status (Sleep Mode), IC will be waked up and enter into operation status if there is a signal input at INT Input Terminal.
- 11.6 High Frequency component and RPM component shall be added external during High Frequency and RPM Measurement. High Frequency component is to reform the frequency of 10MHz~1000MHz and sent to the frequency measurement port via 128 frequency division; RPM component is a device to transform the RPM into electrical impulse, the transmitted impulse can be directly sent to the frequency measurement port.

12. Application

12.1 FS9922_DMM4 Circuitry

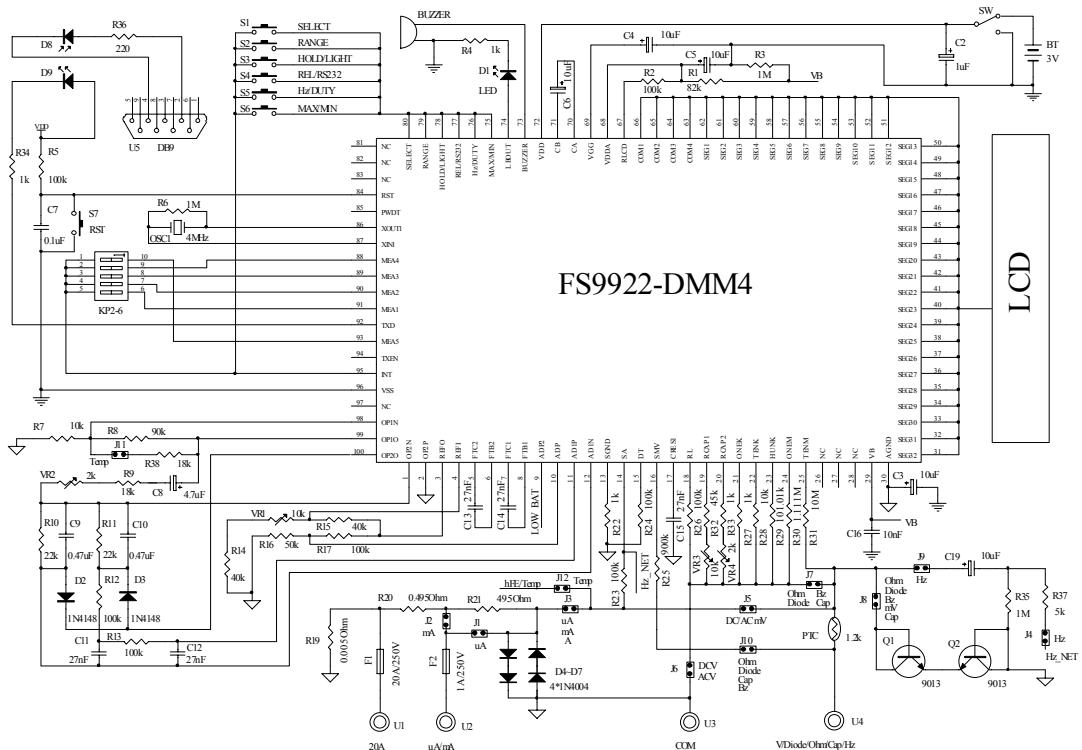

Diagram 3: Application Circuitry

12.3 Power Supply System

VB is the bias current input point in IC. The increase of R1 will reduce the current consumption in IC, but the shortage of bias current will affect the input range of AC measurement.

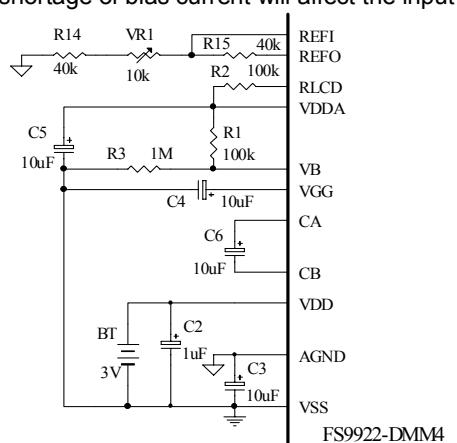

Diagram 4: Power Supply Circuit

AGND is the analog ground connection. Its potential is equal to the middle point of VDDA. The potential of the point is generated in the IC and cannot connect to the middle point of battery. C3 enables AGND stable relative to VSS. C6 is the charge pump, IC let VDD go through C6 to charge/discharge and make VGG to be

double of VDD.

VDDA is the output voltage after the regulation of VGG in the IC. It is about 3.9V relative to VSS.

REFO is the bandgap power source in the IC. It is about 1.2V relative to AGND and has the stability of 100ppm/ $^{\circ}\text{C}$.

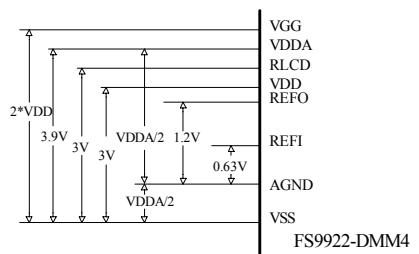

Diagram 5: Relative Voltage at each Point

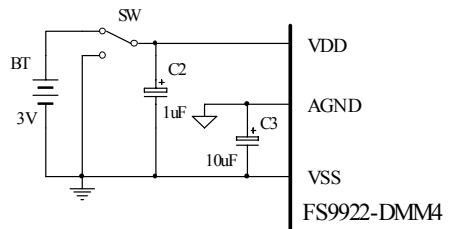

Diagram 6: Power Supply ON/OFF Circuit

Note: In order to avoid “hang up” when FS9922-DMM4 is power-on and off fast, SW should be connected to VSS.

12.4 Power Supply Circuit

The different applications of users make different power supply methods. In some measurements, the sensor requires higher voltage such as OPAMP, Hall device and so on. If it is difficult to supply the power by 3V, then you can take some power supply methods as below.

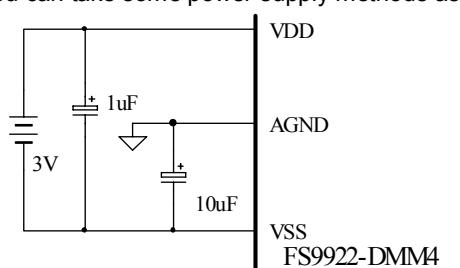

Diagram 7: 3V Power Supply

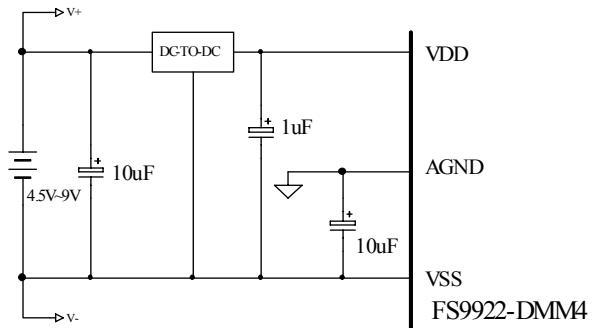

Diagram 8: 4.5V~9V Power Supply

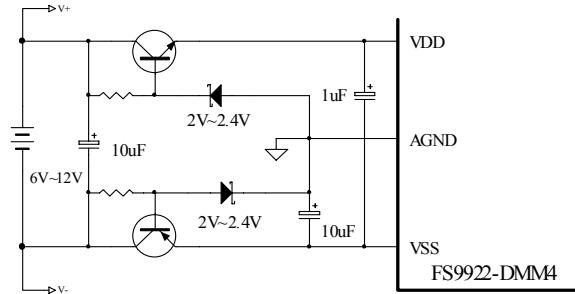

Diagram 9: 6V~12V Power Supply

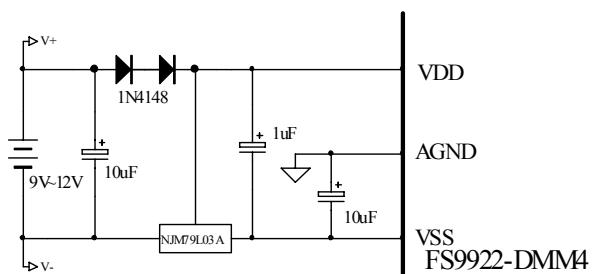

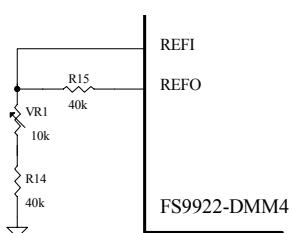

Diagram 10: 9V~12V Power Supply

12.5 Base Power Source

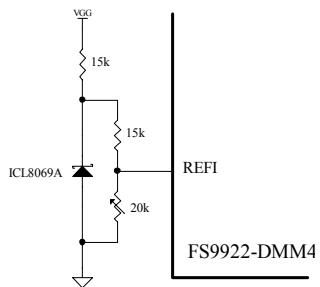

Diagram 12: The Utility of External Base Power Source

12.6 Trigger Reset Circuit

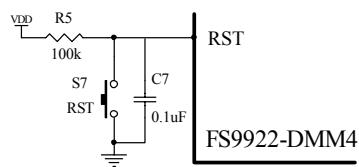

Diagram 13: Reset Circuit

Note: 1. R5 and C7 are the components for reset, which will automatically reset when power on.
 2. S7 is the key for manual reset. May not use it if the manual reset function is not necessary.

12.7 Oscillation Circuit

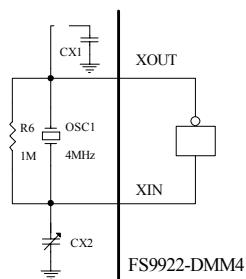

Diagram 14: Oscillation Circuit

In the diagram, R6 is the reverser to provide the static working point; CX2 is the fine adjustment of frequency; CX1 is temperature offset. In less requirements situation, CX1 and CX2 can be unused.

12.8 Buzzer Driver Circuit

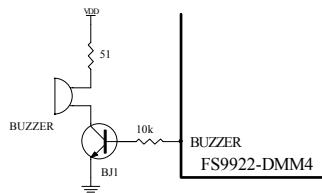

Diagram 15: Low Resistance Buzzer Connection

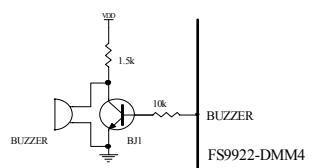

Diagram 16: High Resistance Buzzer Connection

12.9 Mode Switch and Function Control Circuit

For Mode Switch and Function Control, please refer to Diagram 17.

KP1~KP5 are mode switches which are the lock switches. For their functions, please refer to "Measurement Modes Select". S1~S6 are the trigger keys. For their functions, please refer to "Keys Definition" and "Other Functions". In practical application, it depends on the actual situation to decide which switches and keys.

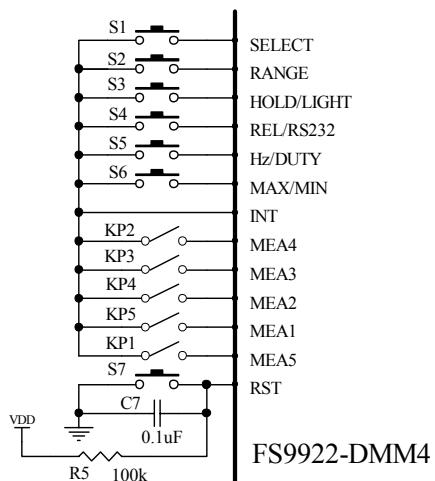

Diagram 17: Mode Switch and Function Control Circuit

12.10 AC Rectification Circuit

Diagram 18 is the average value rectification circuitry of FS9922-DMM4. In the circuit, AC signals enter IC through R31, and then in the process of voltage division through R31, R30, R29, R28 and R27. The divided AC signals come out from OP1O pin and enter IC through ADIP pin and ADIN pin after rectification. VR2 can adjust the signal size to be the calibration of AC measurement.

Diagram 19 is the peak value rectification circuitry. Diagrams 20 and 21 are the true valid value rectification circuitry. Users may determine which rectification circuit to select according to their needs.

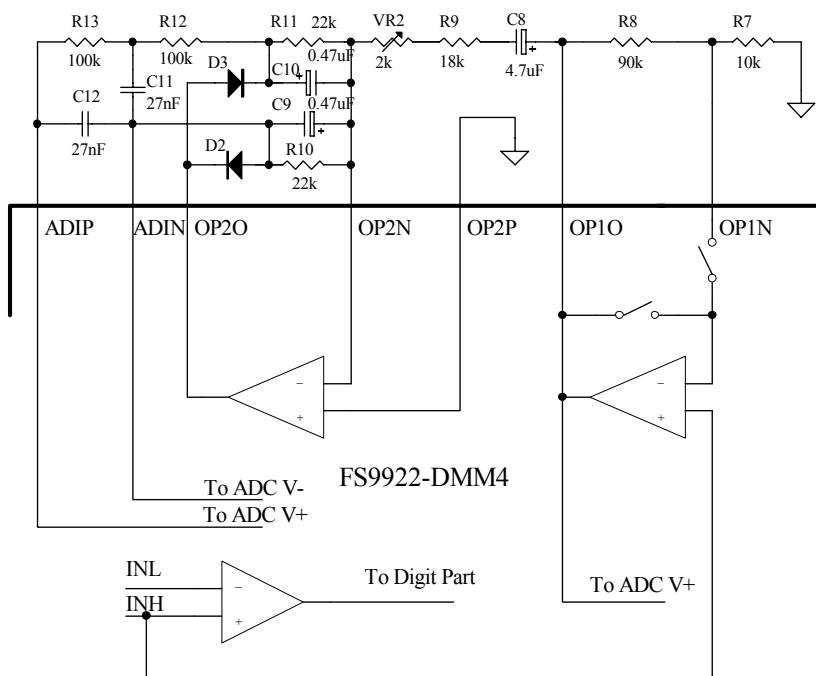

Diagram 18: Average Rectification Circuit

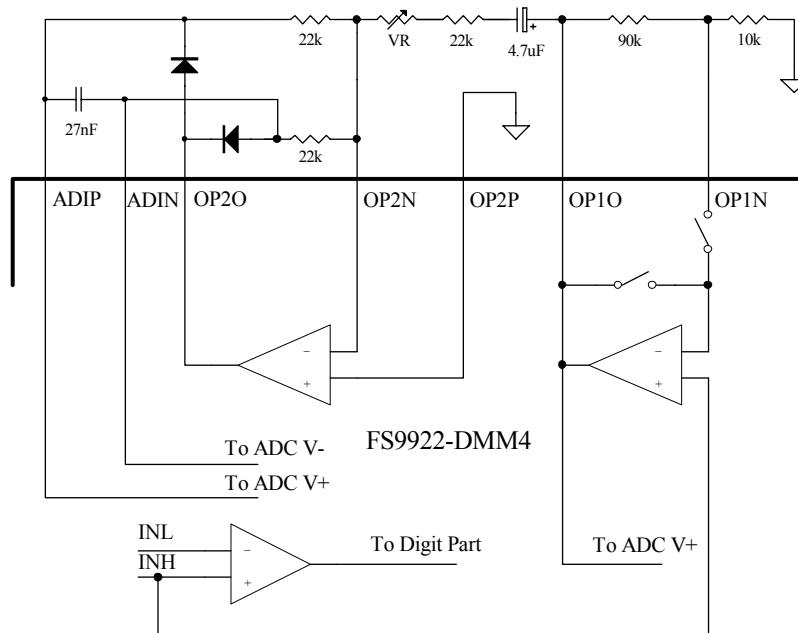

Diagram 19: Peak Value Rectification Circuit

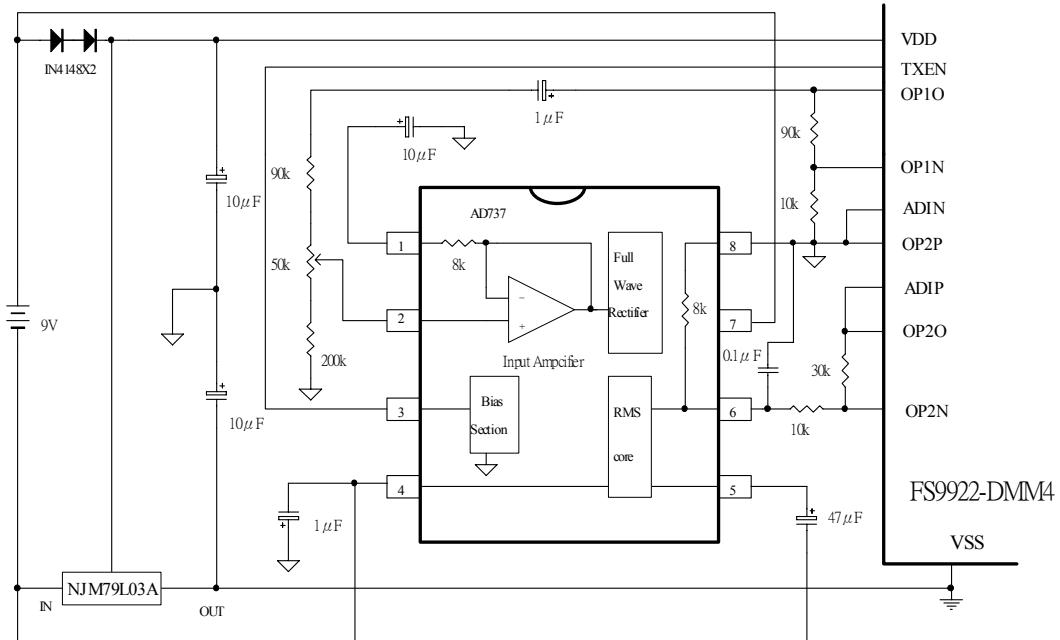

Diagram 20: True Valid Value Rectification Circuit (A)

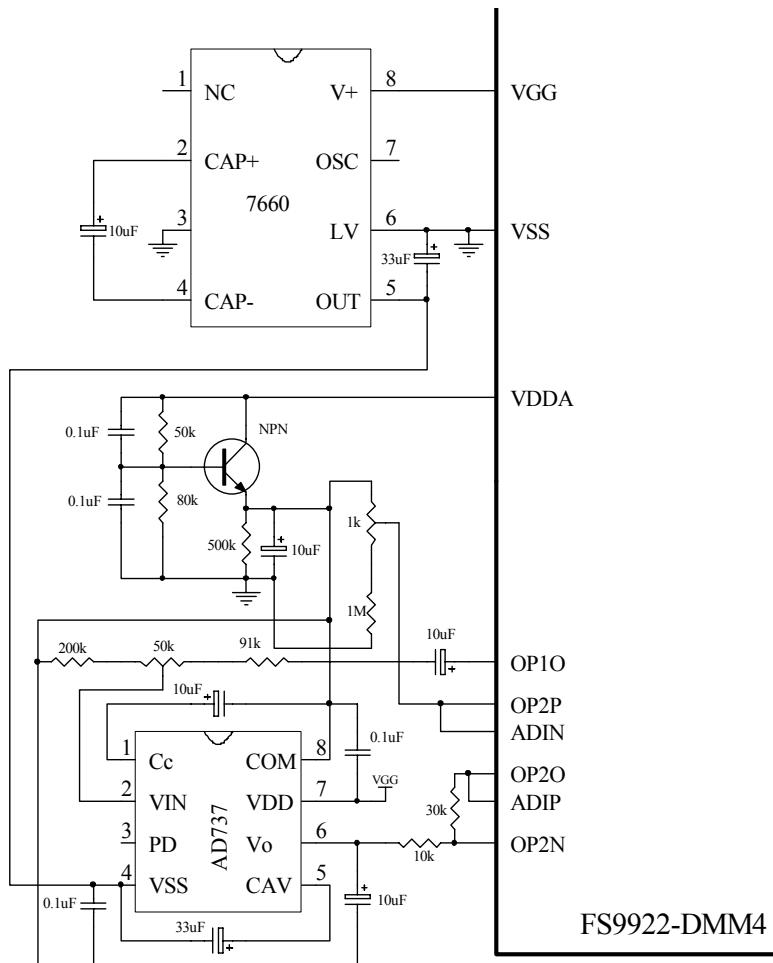

Diagram 21: True Valid Value Rectification Circuit (B)

12.11 Voltage Measurement

Please refer to Diagram 22 for Voltage Measurement.

When doing the voltage measurement, the measured voltage is input from resistance R31, and DCmV is not divided but enter IC directly; the mode voltages of 6V, 60V, 600V, 6000V are divided by R30, R29, R28, R27 and R31 to gain 1/10, 1/100, 1/1000, 1/10000 of the input voltages, then enter IC.

Single AC and DC 60mV/600mV voltage is input by SA.

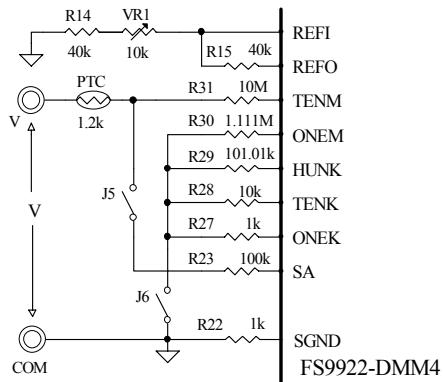

Diagram 22: Voltage Measurement

The formula of voltage division is: $V_{out} = V_{in} \times [R_s / (R_{31} + R_s)]$

R_s is R_{30} 、 R_{29} 、 R_{28} or R_{27} .

Therefore, the accuracy of R_{27} , R_{28} , R_{29} , R_{30} and R_{31} decides the accuracy of each measurement.

Please refer to Diagram 23 for Voltage Division Circuit.

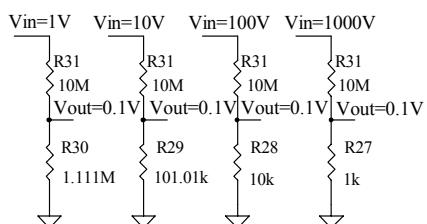

Diagram 23: Voltage Division Circuit

12.12 AC/DC mV Voltage Measurement

Please refer to Diagram 24 for AC/DC mV Voltage Measurement.

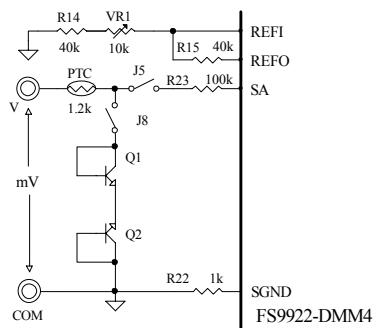

Diagram 24: 60mV/600mV Voltage Measurement

12.13 Current Measurement

Please refer to Diagram 25 for Current Measurement.

When doing the current measurement, the current signals enter IC through R23.

The sampling resistance of μ A mode is $R_{21}+R_{20}+R_{19}$, the sampling resistance of mA mode is $R_{20}+R_{19}$, and the sampling resistance of 60A mode is R_{19} . They are measured respectively through the mode switch. When measuring μ A, J2 is close; when measuring mA, J2 and J3 are close; when measuring the bulk current of 40A mode, J3 is close.

The maximum reduced voltage generated by μ A, mA and 60A modes is 300mV. The accuracy of R_{21} , R_{20} and R_{19} influences the accuracy of current measurement.

Note: The max. reduced voltage is 600mV when the current measurement is under the code No. 00100、01000、00011 and 00101.

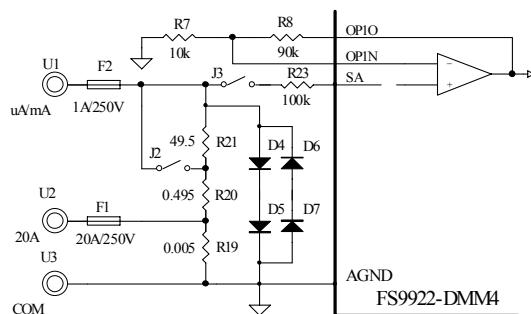

Diagram 25: Current Measurement

12.14 Clamp Meter Circuit

Please refer to Diagram 26 for Clamp Meter Measurement Circuit.

When FS9922-DMM4 is applied to Clamp Meter, the AC/DC sampling signals of 6.000A、60.00A、600.0A and 6000A are input from SA and AGND, and the full scale value is 400mV RMS.

Diagram 26 indicates only the AC application.

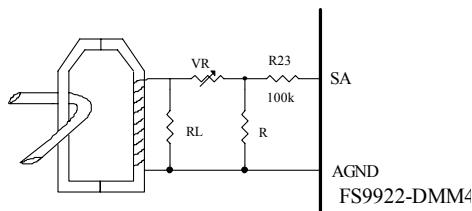

Diagram 26: Clamp Meter Circuit

12.15 Resistance Measurement

Please refer to Diagram 27 for Resistance Measurement.

Resistance measurement refers to the standard resistance, and then takes a comparison between the resistance to be measured and the standard resistance to get the measured resistance value. The standard resistance of 60MΩ mode is 10MΩ (R31). The standard resistance of other modes are R31 to parallel respectively with R30, R29, R28 and R27 to get 1MΩ, 100kΩ, 10kΩ, 1kΩ resistance. When doing resistance measurement, internal IC will generate 0.63V voltage (relative to AGND), the voltage is output respectively to the resistance to be measured through resistance R31, R30, R29, R28 and R27.

R26 connects to RL, which is the negative input of the referenced voltage from the standard resistance. J7 and J10 are mode switches. When doing resistance measurement, J7 and J10 are close.

C15 is the wave filter capacitance of the point to be measured in resistance measurement.

Note:

1. Use SELECT Key can choose Hi Measurement Mode, 600.0MΩ and 6000MΩ Mode can proceed Auto Measurement. Use RANGE Key during Hi Measurement Mode can select 600.0MΩ and 6000MΩ Mode to proceed Manual Measurement.
2. The referenced resistance of 600.0MΩ and 6000MΩ Mode is R31 (10MΩ), the accuracy of the two Measurement Modes is depending on the referenced resistance, and greatly related to the PCB quality and the integration skill.
3. In order to guarantee that the 600.0MΩ and 6000MΩ Mode have respectively the accuracy of $\pm 2\% \times \text{reading}$ and $\pm 5\% \times \text{reading}$, the insulation resistance at Input of Resistance Measurement shall be larger than 30,000MΩ and 120,000MΩ.

If the PCB quality is not good enough or the integration skill can not guarantee the a. m. requirements, the 600.0MΩ and 6000MΩ Measurement Mode shall not be set then.

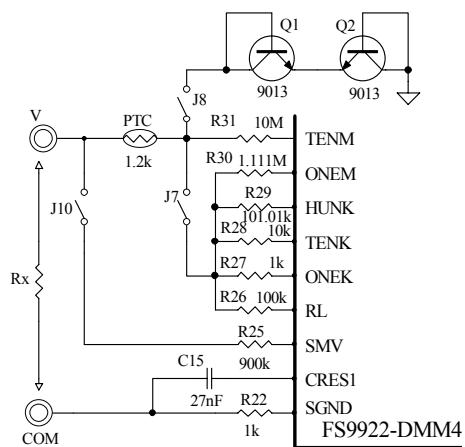

Diagram 27: Resistance Measurement

12.16 Diode Test

Please refer to Diagram 28 for Diode Test.

During the Diode test, 2.7V voltage (relative to AGND) is generated from IC internal, and output through R27, then added to the positive of diode through PTC. The positive reduced voltage VD generated by diode is approx. 0.5V-2.0V. VD is divided by R25 and R26 to be 1/10 of VD , and then amplified 10 times by internal OP to display the VD value. J10 and J7 are mode switches, which are close during diode measurement.

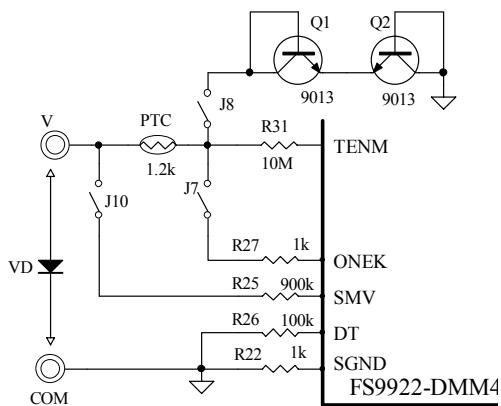

Diagram 28: Diode Test

12.17 Continuity Test

Please refer to Diagram 29 for Continuity Test.

When doing the Continuity Test, the inner of IC will generate 0.63V voltage (relative to AGND), output from R27, and is added to open-short measuring point through PTC. J10 and J7 are mode switches, which are closed during the Continuity Test. Rx gets voltage VRx, and enters IC through R25. From the diagram we know that $Rx = (R27 + PTC) / 50$

So, the resistance value of PTC will influence the top limit of the resistance during Continuity Test. When PTC is not connected, the resistance of the buzzer sound is smaller than 30Ω , if R27 is $1k\Omega$.

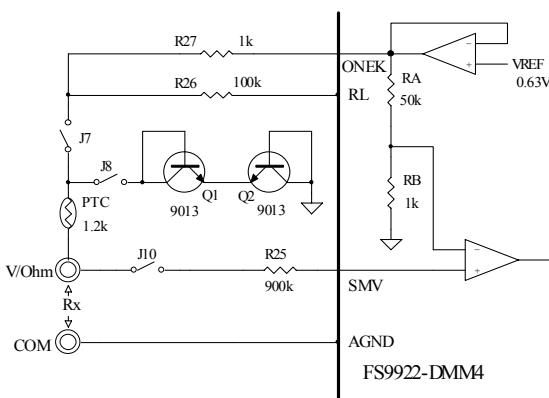

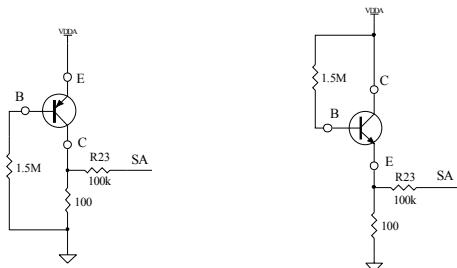

Diagram 29: Continuity Test

12.18 Transistor hFE Test

Please refer to Diagram 30 for Transistor hFE Test.

PNP Type Transistor

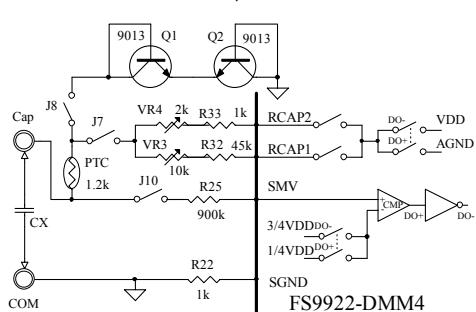

NPN Type Transistor

Diagram 30: Transistor hFE Test

12.19 Capacitance Measurement

Please refer to Diagram 31 for Capacitance Measurement.

Capacitance Measurement is to create oscillation by charging and discharging the measured capacitance through R33 or R32, and to find out the capacitance value by calculating the oscillation cycle. The capacitance measurement reading value can be calibrated through the adjustment of VR3 or VR4. J10 and J7 are mode switches, which are closed during Capacitance measurement.

Typical Wave at Input

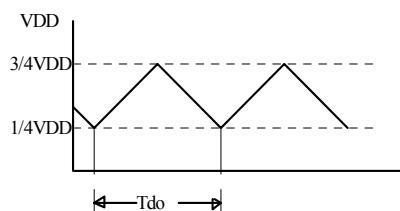

Diagram 31: Capacitance Measurement

12.20 Frequency Measurement

Please refer to Diagram 32 for Frequency Measurement.

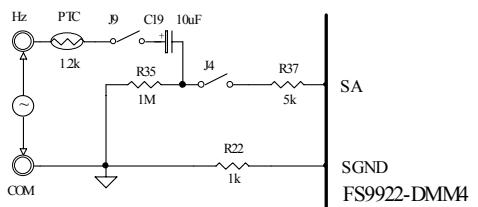

Diagram 32: Frequency Measurement

12.21 High Frequency Measurement

Please refer to Diagram 33 for High Frequency Measurement.

High Frequency component shall be used for 10MHz~1000MHz High Frequency Measurement.

High Frequency component is a device to make 128 frequency division after reforming the high frequency, the impulse amplitude shall be above 200mV RMS after frequency division.

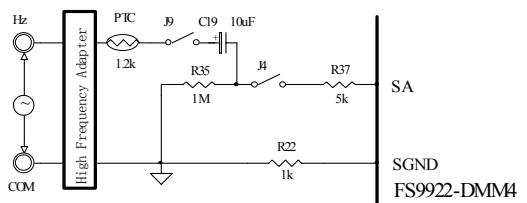

Diagram 33: High Frequency Measurement

12.22 RPM Measurement

Please refer to Diagram 34 for RPM Measurement.

RPM component shall be used for RPM Measurement.

RPM component is a device to transform RPM into electrical impulse, the output impulse amplitude shall be above

200mV RMS.

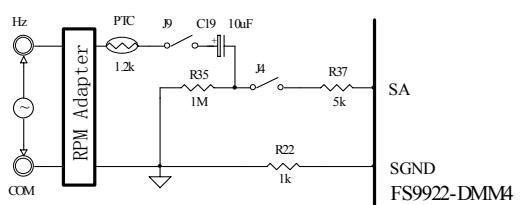

Diagram 34: RPM Measurement

12.23 Temperature Measurement

Please refer to Diagram 35 for Temperature Measurement.

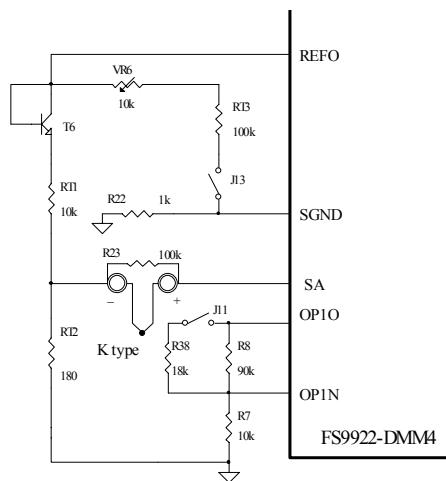

Diagram 35: Temperature Measurement

Description of Diagram 35:

- 1) Diagram 35 the temperature test circuit is for reference only; besides, it is only for the K type thermocouple. No decimal point under Code No. 11111 temperature measurement mode.
- 2) A. In the application of the circuit in Diagram 35, since there is a minor deviation between each IC's referenced voltage, different model of Transistor are adopted for Diode, PN joint's voltage/temperature properties are also different, resulting in different compensation effect at the cold point. Therefore, proper adjustments shall be taken to RT1、RT2 and RT3.
B. V6 is adjusted to 0°C, R38 to be the high point, the scale of K type thermocouple is about 40μV/°C each. Therefore, the OP amplifying time is 2.5.
C: If other thermocouples are used for temperature sensors, users can adjust properly the OP amplifying times according to the Diagram 35.
- 3) There are two measurement process **-273.0°C~+400.0°C (-459.4°F ,+752.0°F)** and **-273°C ~+ 4000°C (-459°F ,+7232°F)** in the Code No. (10111) and (01110) Measurement Mode, which are under the Auto Measurement Mode. To **-273.0°C ~+400.0°C** measurement process, the corresponding scale value is 10.0°C/mV each; to **-273°C ~+ 4000°C** measurement process, the corresponding scale value is 10°C/mV. Therefore, OPs with different amplifying time shall be used respectively depending on different kinds of temperature sensors to reach the requirement of 10.0°C/mV and 10°C/mV. The corresponding °F will be calculated out automatically by referring to °C .

13. RS232 Transmission Specification

13.1 RS232 transmission format is 14 byte. Its transmission rate is 2400 bps. The format is as follow:

Sing	Data Byte					Space	Point	SB1	SB2	SB3	SB4	BAR	EOF	ENTER
1	2	3	4	5	6	7	8	9	10	11	12	13	14	
+/-	X	X	X	X	020H	X	X	X	X	X	X	00DH	00AH	

13.2 14 byte output code location:

- | | |
|------------------------|----------------------|
| a) Sing byte 1: 0f0H ; | h) SB1 byte: 0f7H ; |
| b) Data byte 2: 0f1H ; | i) SB2 byte: 0f8H ; |
| c) Data byte 3: 0f2H ; | j) SB3 byte: 0f9H ; |
| d) Data byte 4: 0f3H ; | k) SB4 byte: 0faH ; |
| e) Data byte 5: 0f4H ; | l) BAR byte: 0fbH ; |
| f) Space byte: 0f5H ; | m) EOF byte: 0fcH ; |
| g) Point byte: 0f6H ; | n) ENTER byte: 0fdH. |

13.3 Sing byte stands for the positive or negative sign of DMM measuring signal, and its output code is ASCII code:

- | | |
|------------------------|-------------------------|
| a) positive (+) : 02BH | b) negative (-) : 02DH. |
|------------------------|-------------------------|

13.4 Data byte is 4 byte that stands for DMM measured data, and its output code is ASCII code:

- | | |
|------------------------------------|------------------------------------|
| a) Date byte 2: stands for Lcd_1 ; | c) Date byte 4: stands for Lcd_3 ; |
| b) Date byte 3: stands for Lcd_2 ; | d) Date byte 5: stands for Lcd_4. |

13.5 Point Byte stands for the decimal location, and its output code is Hex code:

- | |
|---|
| a) Point 「0」: 030H stands for no decimal and LCDs 「0000」 ; |
| b) Point 「1」: 031H stands for no decimal and LCDs 「0.000」 ; |
| c) Point 「2」: 032H stands for no decimal and LCDs 「00.00」 ; |
| d) Point 「3」: 033H stands for no decimal and LCDs 「000.0」 . |

13.6 SB1 Byte code is as follow (SB1), and its output code is Hex code:

Status	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
0								
1	0	0	AUTO	DC	AC	REL	HOLD	BPN

13.7 SB2 Byte code is as follow (SB2), and its output code is Hex code:

Status	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
0								
1	Z1	Z2	MAX	MIN	APO	Bat	n	Z3

13.8 SB3 Byte code is as follow (SB3), and its output code is Hex code:

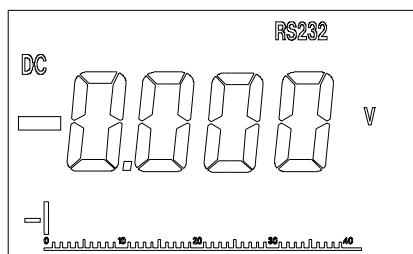

Status	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
0								
1	μ	m	k	M	Beep	Diode	%	Z4

13.9 SB4 Byte code is as follow (SB4), and its output code is Hex code:

Status	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
0								
1	V	A	Ω	hFE	Hz	F	°C	°F

13.10 Bar byte: Bit 7 stands for the positive or negative; Bit 0~6 stands for Bar graph number. Its output code is Hex code.

13.11 Example: measuring voltage mode [MEAS: 11010] : input 0V. LCD is as follow:

13.12 RS232 Output Format:

2D-30-30-30-30-20-31-11-00-00-80-80-0D-0A

13.13 RS232 Output Wave Form
