

## 5V/3.3V 128KX8 CMOS SRAM (Evolutionary Pinout)

## Features

- AS7C1024A (5V version)
- AS7C31024A (3.3V version)
- Industrial and commercial temperatures
- Organization: 131,072 words x 8 bits
- High speed
  - 10/12/15/20 ns address access time
  - 5, 6, 7, 8 ns output enable access time
- Low power consumption: ACTIVE
  - 853 mW (AS7C1024A) / max @ 10 ns
  - 522 mW (AS7C31024A) / max @ 10 ns
- Low power consumption: STANDBY
  - 55 mW (AS7C1024A) / max CMOS
  - 36 mW (AS7C31024A) / max CMOS
- Latest 6T 0.25u CMOS technology
- Easy memory expansion with  $\overline{CE1}$ , CE2,  $\overline{OE}$  inputs
- TTL/LVTTL-compatible, three-state I/O
- 32-pin JEDEC standard packages
  - 300 mil SOJ
  - 400 mil SOJ
  - 8 x 20mm TSOP 1
  - 8 x 13.4mm sTSOP 1
- ESD protection  $\geq 2000$  volts
- Latch-up current  $\geq 200$  mA

## Functional description

The AS7C1024A and AS7C31024A are high performance CMOS 1,048,576-bit Static Random Access Memory (SRAM) devices organized as 131,072 words x 8 bits. It is designed for memory applications where fast data access, low power, and simple interfacing are desired.

Equal address access and cycle times ( $t_{AA}$ ,  $t_{RC}$ ,  $t_{WC}$ ) of 10/12/15/20 ns with output enable access times ( $t_{OE}$ ) of 5, 6, 7, 8 ns are ideal for high performance applications. Active high and low chip enables ( $\overline{CE1}$ , CE2) permit easy memory expansion with multiple-bank systems.

When  $\overline{CE1}$  is high or CE2 is low the devices enter standby mode. If inputs are still toggling, the device will consume  $I_{SB}$  power. If the bus is static, then full standby power is reached ( $I_{SB1}$ ). For example, the AS7C31024A is guaranteed not to exceed 36mW under nominal full standby conditions. All devices in this family will retain data when VCC is reduced as low as 2.0V.

A write cycle is accomplished by asserting write enable ( $\overline{WE}$ ) and both chip enables ( $\overline{CE1}$ , CE2). Data on the input pins I/O0-I/O7 is written on the rising edge of  $\overline{WE}$  (write cycle 1) or the active-to-inactive edge of  $\overline{CE1}$  or CE2 (write cycle 2). To avoid bus contention, external devices should drive I/O pins only after outputs have been disabled with output enable ( $\overline{OE}$ ) or write enable ( $\overline{WE}$ ).

A read cycle is accomplished by asserting output enable ( $\overline{OE}$ ) and both chip enables ( $\overline{CE1}$ , CE2), with write enable ( $\overline{WE}$ ) high. The chips drive I/O pins with the data word referenced by the input address. When either chip enable is inactive, output enable is inactive, or write enable is active, output drivers stay in high-impedance mode.

## Absolute maximum ratings

| Parameter                                        |            | Symbol            | Min   | Max                    | Unit |
|--------------------------------------------------|------------|-------------------|-------|------------------------|------|
| Voltage on V <sub>CC</sub> relative to GND       | AS7C1024A  | V <sub>t1</sub>   | -0.50 | +7.0                   | V    |
|                                                  | AS7C31024A | V <sub>t1</sub>   | -0.50 | +5.0                   | V    |
| Voltage on any pin relative to GND               | Both       | V <sub>t2</sub>   | -0.50 | V <sub>CC</sub> + 0.50 | V    |
| Power dissipation                                | Both       | P <sub>D</sub>    | —     | 1.0                    | W    |
| Storage temperature (plastic)                    | Both       | T <sub>stg</sub>  | -65   | +150                   | °C   |
| Ambient temperature with V <sub>CC</sub> applied | Both       | T <sub>bias</sub> | -55   | +125                   | °C   |
| DC current into outputs (low)                    | Both       | I <sub>OUT</sub>  | —     | 20                     | mA   |

Note: Stresses greater than those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## Truth table

| $\overline{CE1}$ | CE2 | $\overline{WE}$ | $\overline{OE}$ | Data             | Mode                             |
|------------------|-----|-----------------|-----------------|------------------|----------------------------------|

### Write waveform 1 ( $\overline{WE}$ controlled)<sup>10,11,12</sup>

### Write waveform 2 ( $\overline{CE1}$ and CE2 controlled)<sup>10,11,12</sup>

## AC test conditions

- Output load: see Figure B or Figure C.
- Input pulse level: GND to 3.0V. See Figure A.
- Input rise and fall times: 2 ns. See Figure A.
- Input and output timing reference levels: 1.5V.

Figure A: Input pulse

Figure B: 5V Output load

Thevenin equivalent:  
 $D_{OUT} \xrightarrow{168\Omega} +1.728V$  (5V and 3.3V)

Figure C: 3.3V Output load

## Notes

- 1 During  $V_{CC}$  power-up, a pull-up resistor to  $V_{CC}$  on  $\overline{CE1}$  is required to meet  $I_{SB}$  specification.
- 2 This parameter is sampled and not 100% tested.
- 3 For test conditions, see *AC Test Conditions*, Figures A, B, and C.
- 4  $t_{CLZ}$  and  $t_{CHZ}$  are specified with  $CL = 5pF$ , as in Figure C. Transition is measured  $\pm 500mV$  from steady-state voltage.
- 5 This parameter is guaranteed, but not 100% tested.
- 6  $\overline{WE}$  is High for read cycle.
- 7  $\overline{CE1}$  and  $\overline{OE}$  are Low and  $CE2$  is High for read cycle.
- 8 Address valid prior to or coincident with  $\overline{CE1}$  transition Low.
- 9 All read cycle timings are referenced from the last valid address to the first transitioning address.
- 10  $\overline{CE1}$  or  $\overline{WE}$  must be High or  $CE2$  Low during address transitions. Either  $\overline{CE1}$  or  $\overline{WE}$  asserting high terminates a write cycle.
- 11 All write cycle timings are referenced from the last valid address to the first transitioning address.
- 12  $\overline{CE1}$  and  $CE2$  have identical timing.
- 13  $C = 30pF$ , except all high Z and low Z parameters,  $C = 5pF$ .
- 14 2V data retention applies to commercial temperature operating range only.

## Typical DC and AC Characteristics
